LIQOSEAL®

CERTAINTY IN WATERTIGHT DURAL CLOSURE

Cerebrospinal fluid (CSF) leakage is a widely recognized complication after neurosurgical procedures. It represents a significant patient burden, resulting in increased morbidity, prolonged hospital stays, possible surgical revisions, and enhanced costs.^{1,2} Incidence rates vary depending on age, indication, location of surgery and underlying pathology, but in total CSF leakage occurs in 4-32% of surgical cases.^{3,4}

Achieving **watertight dural closure** to provide effective control of CSF leakage is a challenge. A puncture from a single needle is sufficient to cause leakage, and during prolonged operative procedures, the fragile dura mater shrinks due to dehydration, further complicating closure.

Effective dural sealants should reduce the risk of CSF leakage after cranial surgery by enhancing dural closure. **However, a recent review showed that existing commercially available dural sealants have not proven to significantly reduce post-operative CSF leakage compared to suturing alone (8.2% versus 8.4% respectively).**³

*“Extreme dura adherence and burst pressure. Fibrotic layer formation (‘neodura’) on top of the device”
(van Doormaal et al. 2018)*

- Excellent ease-of-use⁵
- Effective leakage control⁵ - the right strength and resilience to endure the fluctuating intradural fluid pressures and lasting adherence to the dura mater
- Extraordinary adhesion to the dura mater^{6,7}
- Bridges dural gaps up to 10 mm⁹
- Does not adhere to brain tissue (data on-file)
- Acute and long-term watertight closure of the suture-line for gaps up to 3mm
- Scaffold for new fibrotic layer formation (dura regeneration, ‘neodura’)^{5,7}

- Polyurethane sheet for sealing against leakage
- Lactide-caprolactone copolymer foam with a synthetic adhesive for adherence to the dura

LIQOSEAL® compares favorably to existing available products.^{4,6}

Key features and benefits

- **EFFECTIVE** – Watertight dural closure provides effective control of CSF leakage after cranial surgery, resulting in reduced patient burden and health care costs.
- **ENDURING** – Strong and durable tissue adherence enables LIQOSEAL® to endure fluctuating physiological CSF pressures throughout the critical 30-day healing period.
- **SUPPORTS HEALING** – LIQOSEAL® supports regeneration of the dura mater by acting as a scaffold for new fibrotic layer formation (‘neodura’).
- **EASY TO USE** – The soft and pliable patch is easy to apply and ready to use, requiring no time-consuming preparation or applicators.
- **SAFE** – The smart composition from synthetic, bioresorbable polymers, defines timely resorption and ensures a good safety profile, with no clinically significant post-operative swelling, minimizing the risk of neural compression.
- **DEDICATED DEVELOPMENT** – LIQOSEAL® was developed in close collaboration with neuro-surgeons using an evidence-based approach, in direct response to their demands for more effective dural sealants.
- **PROVEN TECHNOLOGY** – LIQOSEAL® uses Polyganics’ proprietary bioresorbable polymer technology, already applied worldwide in multiple clinical areas.

Ordering information

Article number	Size
DS01-024/08	8x8 cm
DS01-015/05	5x5 cm

LIQOSEAL® is supplied as 1 unit per box. It is packed in a Tyvek blister and subsequently placed in an aluminum pouch and carton box. LIQOSEAL® is a double-layered patch (white color site and green-blue fluid barrier) and is indicated for single use. It is supplied sterile. It should be stored in the freezer between -15 °C and -30 °C. The shelf life is 36 months. Within 8 months the device is considered to be essentially resorbed and integrated (based on animal data)⁵

LIQOSEAL® indicated for use as an adjunct to standard methods of cranial dural repair during surgery, providing watertight closure of the dura mater to effectively control CSF leakage.
